ACKNOWLEDGEMENTS

We gratefully acknowledge the Montana Breast Cancer Resource Guide Committee for sharing information and ideas for the Montana Mammography Directory. We also acknowledge the Montana Affiliate of Susan G. Komen for the Cure, the Idaho and Montana Cancer Control Programs and the Centers for Disease Control and Prevention for their pioneering work in breast health education for women living with disability and for sharing information for the production of this Directory.

Finally, our sincere thanks go to our Volunteers, Disability Advocates, and Mammography Facility staff members without whose assistance and sharing of their expertise the Directory would not have been possible.

Disclaimer: Every attempt has been made to make this guide as inclusive as possible. No resource in this guide is required to pay for its listing. All information has been provided by the individual resource, and its inclusion in this guide does not imply endorsement by mammography clinics. Non-inclusion does not imply any judgment of the merit of the resource.

Definitions of Terms

In the 2015 Montana Mammography Directory, the following terms are defined as:

Breast Cancer Support Group – Peer or professionally-guided meetings for breast cancer survivors, people undergoing treatment for breast cancer, and their families.

Breast Cancer Patient Navigator – A navigator is a single point of contact for cancer patients and their families. The navigator is an educator, an advocate and a friend. The navigator is a specially trained professional who assists in all aspects of the patient's care experience. When clinical issues arise, a navigator can refer patients to the appropriate healthcare provider office or other healthcare resource.

Breast Prosthetics – Artificial substitute for an absent breast.

Breast Reconstruction – Surgical reconstruction of a breast after removal of breast tissue.

Breast Self-Examination (BSE) – A technique to examine one's own breasts by looking and feeling for changes. BSE is a tool that can be used to both increase awareness of breast cancer and to learn about what changes in the breast should be reported. BSE is recommended beginning at age 20.

Breast Tomosynthesis (three-dimensional (3D) mammography) and digital breast tomosynthesis (DBT), is an advanced form of breast imaging where multiple images of the breast from different angles are captured and reconstructed ("synthesized") into a three-dimensional image set. In this way, 3D breast imaging is similar to computed tomography (CT) imaging in which a series of thin "slices" are assembled together to create a 3D reconstruction of the body.

Chemotherapy – Treatment of cancer with certain drugs that destroy cancer cells.

Clinical Breast Exam – Examination of the breasts and surrounding area by a trained healthcare provider.

Clinical Trials – Carefully designed and monitored studies of new methods for treating or preventing cancer.

Complementary Therapies – Treatments such as acupuncture, chiropractic, homeopathy, massage, meditation, art, dance, or nutrition which may reduce stress and/or boost the immune system. Often used along with traditional medical treatment.

Computerized Tomography (CT) – Cross-sectional x-rays that detect or monitor tissue abnormalities.

Contract Radiologist – Radiologist services provided under facility contract. Generally used for facilities that may not have on-site radiologists available on a full or part-time basis.

Computer Assisted Device (also known as Computer Aided Detection) – Computerized algorithms that assist the radiologist in identifying types of breast tissue.

Core Needle Biopsy – Core needle biopsy uses a thin, hollow needle to remove samples of tissue from the breast. It can be used on suspicious areas that can be felt (palpable masses) and those that can only be seen on a mammogram or other imaging test (nonpalpable masses).

Counseling – Treatment of emotional discomfort through the use of psychological techniques that encourage communication of conflict, insight into problems and personal growth.

Dual Energy X-ray Absorptiometry (DXA, previously DEXA) – is a means of measuring bone mineral density (BMD).

Digital Mammography Machine – Newer full-field digital mammography units capture the picture on an electronic digital detector, and the image is then displayed on a video monitor. Digital mammography also offers the advantages that images can be stored and retrieved easily and transmitted electronically for review by another radiologist.

Financial Assistance – Direct assistance or referral to appropriate sources, which may provide financial counseling or direct monetary support for medical procedures and treatments.

Film (“Analog”) Mammography Machine – A machine that produces a black and white x-ray picture of the breast tissue. Today, many mammography units are screen-film units, which mean they produce the mammography picture on x-ray film.

Fine Needle Aspiration/Biopsy – Fine needle aspiration (also known as fine needle biopsy) is a needle biopsy that removes cell samples rather than tissue samples from an abnormal area of the breast.

Galactograms – Galactography is an x-ray examination that uses mammography and a contrast material to obtain pictures of the inside of the breast's milk ducts.

Genetic Risk Counseling – Education, information and discussion of genetic factors that may put certain family members at risk for inheriting the potential to develop breast cancer.

Hospice – A philosophy of delivery of care emphasizing comfort, peace of mind and control of symptoms, usually involved when life expectancy is short.

Incisional Biopsy – A biopsy in which only a sample of the suspicious tissue is cut into (incised) and removed for the purpose of diagnosis. An incisional biopsy is in contrast to an excisional biopsy in which an entire lesion, usually a tumor, is removed.

Indian Health Services (IHS) – Responsible for providing federal health services to American Indians and Alaska Natives.

Magnetic Resonance Imaging (MRI) – A method of creating three-dimensional images of the body using a magnet and radio waves instead of x-rays.

Mammogram (Diagnostic) – Diagnostic mammography is an x-ray exam of the breasts that is performed in order to evaluate a breast complaint or abnormality detected by physical exam or routine screening mammography. Diagnostic mammography is different from screening mammography in that additional views of the breast are usually taken, as opposed to two views typically taken with screening mammography. Thus, diagnostic mammography is usually more time-consuming and more costly than screening mammography.

Mammogram (Screening) – An x-ray of the breast that includes two views and is used for comparison with previous and subsequent mammograms.

Medicaid – A federal program that reimburses hospitals and healthcare providers for providing health care to qualifying people who meet established financial criteria.

Medicare – A program under the US Social Security Administration that reimburses healthcare providers and hospitals for health care provided to qualified patients 65 years or older or patients with a disability.

Needle Localization – A procedure that uses very thin needles or guide wires to mark the location of an abnormal area of tissue so it can be surgically sampled. An imaging device such as an ultrasound probe is used to place the wire in or around the abnormal area. Needle localization is used when the healthcare provider cannot feel the mass of abnormal tissue.

Physical Therapy – Treatment by physical methods such as massage and exercise; treatment of injury to restore strength and range of motion.

Positive Emission Tomography (PET) Scan – A nuclear medical imaging technique that produces a three-dimensional image or picture of functional processes in the body.

Provide A Referral – Some mammography centers allow women to self-order a mammogram. They will require that the patient provide them with the name of a healthcare provider who will receive the test results and follow up on any abnormalities. Other centers require an order from a healthcare provider in order to do the mammogram.

Radiation Therapy – Treatment by x-ray machines to deliver high-energy radium or cobalt used to reduce the size of tumors.

Referral – Directing individuals to service providers such as specialists or support groups.

Second Opinion – Examination of a patient or a patient's records by a second physician for treatment recommendations.

Stereotactic Biopsy – Removal of small samples of breast tissue for microscopic evaluation using a hollow (core) needle which is precisely guided to the correct location via x-rays and computer coordinates.

Transportation – Assistance to and from medical and support systems.

Tumor Board – A panel of experts in radiology, oncology, surgery, and pathology that makes treatment recommendations.

Tumor Registry – A system designed for the collection, management and analysis of information about patients with a cancer diagnosis.

Ultrasound (Sonogram) – Non-invasive medical imaging that uses high-frequency sound waves to generate images of breast masses.

Key to Disability Access Terms

The information about disability access for each facility is based on the following definitions:

BUILDING ACCESS

Standard Accessible Parking

- A parking space that is at least eight feet wide
- With an adjoining access aisle at least five feet wide
- With signage displaying the international symbol of accessibility

Van Accessible Parking

- A parking space that is at least eight feet wide
- With an adjoining access aisle at least eight feet wide
- With signage displaying the international symbol of accessibility and the words "Van Accessible"

Accessible Exterior Route and Doors

The path from parking and pedestrian walkways to the building entrance has

- A slope of 1:20 or less (No more than one inch of vertical rise for every 20 inches of horizontal rise)
- A minimum clear width of 36" for the entire route of travel
- A stable, firm, and slip resistant pathway
- Ramped curb cuts at the curbs
- Ramps or other means of access provided where there are level changes greater than ½"
- No protruding objects that reduce the clear width of travel

Accessible Building Entrance, Exterior Door

- Doorway at least 32 inches wide
- Handle that can be used with a closed fist. For example, a lever handle is usable; a round doorknob is not usable.
- Requires no more than 15 lbs of force to open

ACCESSIBLE INTERIOR PATH

The paths to the waiting area, restrooms, and program areas have

- Stable, firm, slip-resistant surfaces
- A minimum clear width of 36" for the entire route of travel
- Ramps or other means of access provided where there are level changes greater than ½"
- No protruding objects that reduce the clear width of travel

Accessible Interior Doors, defined as

- Doorway at least 32 inches wide
- Handle that can be used with a closed fist. For example, a lever handle is usable; a round doorknob is not usable.
- Requires no more than 5 lbs of force to open

ACCESSIBLE MAMMOGRAPHY ROOM

Accessible Doors

- Doorway at least 32 inches wide
- Handle that can be used with a closed fist. For example, a lever handle is usable; a round doorknob is not usable
- Requires no more than 5 lbs of force to open

Accessible Route and enough space to move around machine

- Is on an accessible route
- Stable, firm, slip resistant surfaces
- A minimum clear width of 36" for the entire route of travel
- No protruding objects that reduce the clear width of travel
- A T-shaped clear floor space or one that is 60" in diameter for a wheelchair to make a 180° turn on the side of the mammography machine with the x-ray plate

Lowest Height of the x-ray plate from the floor

- Distance from the floor to the top of the x-ray plate (number of inches)
- The closer to the floor the plate can be lowered, the more easily a seated woman can be accommodated.

ACCESSIBLE RESTROOM

Accessible Doors

- Doorway at least 32 inches wide
- Handle that can be used with a closed fist. For example, a lever handle is usable; a round doorknob is not usable.
- Requires no more than 5 lbs of force to open

Accessible Route and Turning Space

- A T-shaped clear floor space or one that is 60" in diameter for a wheelchair to make a 180° turn OR a five by six foot accessible stall
- Toilet is located on the 60" wall
- At least 42" clear floor space from the center line of the toilet to the wall

Accessible Toilet, Fixtures and Sink

- Toilet seat measures 17 to 19 inches high
- Horizontal grab bars 1 ¼ to 1 ½ inch in outside diameter securely mounted at the near side wall and rear of toilet
- Toilet paper dispenser mounted on side wall closest to the toilet at least 24 inches above the floor
- Sink handles that can be used with a closed fist
- At least 27 inches of knee clearance below the bottom of the sink

Right to Know Tip Sheet

It's your life.

And no one can protect it better than you.

— JUDI, BREAST CANCER SURVIVOR

BREAST CANCER

Breast cancer is the most common cancer in women. And living with a disability does not make you immune. Know the facts about breast cancer and why you need to make screening a regular part of your health care.

- An estimated 234,000 new cases of breast cancer will be diagnosed in American women this year.
- Women with disabilities are just as likely to be at risk for breast cancer as women without disabilities; the biggest risk factors are being a woman and aging.
- The chances of getting breast cancer increase with age. One out of every 8 women will get breast cancer at some point in her life.
- Finding breast cancer early increases chances of survival. If breast cancer is caught early, 9 out of every 10 women survive more than 5 years.
- Getting tested regularly for breast cancer is the best way for women to lower their risk. Mammography can help find cancer early when it's most treatable.

GETTING SCREENED

As a woman living with a disability, you may face a number of challenges that make it difficult to get a quality mammogram and clinical exam. Here are some tips to make it easier.

When scheduling a mammography, ask:

- How should I dress?
- How do I prepare if I use a wheelchair or a scooter?
- Can the machine be adjusted so I can remain seated?
- How long is the appointment and can I have additional time if I need it?

Let the scheduling staff know that you can/cannot:

- Sit upright with or without assistance.
- Lift and move your arms.
- Transfer from your chair/scooter.
- Undress/dress without assistance.

When preparing for your mammogram, remember:

- Wear a blouse that opens in the front
- Wear a bra that you can easily remove
- Do not wear deodorant or body powder
- Talk to your healthcare provider about any disability-related concerns

If you are 40 to 49 years old, talk to your doctor about getting a mammogram.
If you are 50 or older, be sure to get a mammogram every two years. For more information, visit www.cdc.gov/RightToKnow or call 1-800-CDC-INFO (232-4636); 1-888-232-6348 (TTY).

The mission of the Montana Cancer Screening Program is to reduce breast and cervical cancer deaths among Montana women by providing ongoing quality screening services and education in a manner that is appropriate, accessible, cost-effective and sensitive to women's needs.

The Montana Cancer Screening Program provides mammograms, clinical breast exams, Pap tests and pelvic exams for the early detection of breast and cervical cancer. These services may be provided [free to eligible women](#).

Montana Resources

The Montana Disability and Health Program maintains a mammography directory, which provides information on mammography service providers by city. Each entry includes contact information, hours of operation, standard and additional services available, and disability access information.

The CDC created health promotion materials (e.g., posters, MP3 files, low-tech fliers, print advertisements, and tip sheets) to increase awareness of breast cancer among women with physical disabilities and encourage these women to get screened. Materials share the tagline "Breast Cancer Screening. The Right to Know," and feature four women with physical disabilities who have survived breast cancer.³

Free "Right to Know" materials are available online at <http://www.cdc.gov/ncbddd/disabilityandhealth/righttoknow/>

Breast Cancer and Women with Disabilities

Women in the United States get breast cancer more than any other type of cancer except for skin cancer.¹ In Montana, an average of 800 women are diagnosed with breast cancer each year.² Breast cancer screening means checking a woman's breasts for cancer before there are signs or symptoms of the disease. Doctors recommend that women have regular clinical breast exams and mammograms to find breast cancer early. When abnormal tissue or cancer is found early, it may be easier to treat.¹

Breast cancer is a major public health concern for all women, including women with disabilities. In the U.S., women who have disabilities are just as likely as women without disabilities to have ever received a mammogram. However, they are significantly less likely to have been screened within the recommended guidelines.³ Barriers to screening include: thinking "it won't happen to me"; focusing on other health issues; difficulty with positioning while getting a mammogram; not knowing where to go for accessible screening; inaccessible facilities and equipment; and the provider's knowledge and attitudes.³ Providers should ensure that they are not only treating a woman's disability, but are regularly addressing screening for breast cancer and other conditions for which screening is recommended.

Tips to Increase Breast Cancer Screening Rates for Women with Disabilities

- Train scheduling staff, radiologic technologists and providers on appropriate communication and screening techniques for women with disabilities. This training can ensure that more women are screened for breast cancer within the recommended guidelines.
- When scheduling a woman with a disability for breast cancer screening, it is often useful for staff to ask questions to determine what additional assistance or time may be needed to complete the screening test.
- Become familiar with methods to assist a person with a disability during an exam, to avoid embarrassment and frustration for both the patient and the staff member.
- The provider and patient should discuss specific needs and preferences during screening, such as assistance with undressing, seated mammograms, and additional time for appointments.
- Office staff and providers can create a practice that is physically accessible and accommodating for everyone, regardless of ability. A universally accessible practice may increase the likelihood that patients with disabilities will seek out and obtain regular preventive health care services.⁴
- Information in the document titled "Access to Medical Care for Individuals with Mobility Disabilities" can assist providers in understanding how to work with patients with disabilities, as well as determining how to make exam rooms and equipment accessible. http://www.ada.gov/medcare_ta.htm
